

## ABSTRACT

### DIE EJECTOR SYSTEM USING LINEAR MOTOR

5

The invention provides a die ejector system and method for removing a die from an adhesive surface. The system comprises an ejector tool that is operative to move relative to the die whereby to push the die. The ejector tool may consist of a collet holder and an ejector pin array. A shaft holds the  
10 ejector tool and is in turn coupled to a forcer of a linear motor. The forcer is movable relative to a stator of the linear motor. After the die is pushed by the ejector tool, a die pick-up device removes the die from the adhesive surface.
